SET 3

Answer 1:

(Explain any 2 of the 8 rules)
A sample answer is given below:

Consistency: UI components design must be of the same style, theme, position and structure so that it is easy for the users to use and remember.
Ex: Facebook has the same UI design on laptops as well as on smartphones

Reversal: A good UI must have options to reverse your action, so that the user can freely explore the application
Ex: You can always go back on Foodpanda if you have selected the wrong food item

Answer 2:

Technical Test: Testing the non-functional aspects of a software such as security, usability, performance etc.
Ex: You are testing how your software performs when the number of users increases.

Load Test: Testing the system with the maximum possible capacity, to check its performance if the maximum number of users use the software.
Ex: UIU has 10,000 students and we test UCAM using 10,000 users doing the same thing at the same time.

SET 4

Answer 1:

(Explain any 2 of the 10 heuristics)
A sample answer is given below:

Minimalism: UI design should be minimalistic but informative enough to do the task
Ex: In a login page, we do not write texts like “Write your email”, “Write your password” , instead only “Email” and “Password” is minimal enough to understand the task

Help: Provide help for users
Ex: Many applications give a step by step tutorial whenever you are using the feature for the first time.

Answer 2:

System Test: Testing the entire completed and integrated system.
Ex: After merging all the features, the developers did several system tests to check whether the entire application works properly or not

White Box Test: Testing a software while knowing the internal code and mechanisms, giving input and output to specifically test the internal parts of the code.
Ex: Unit test, Security test are examples of white box tests.
